1. Given the following declaration, write a snippet of C code that might lead to strlen(arr) returning no less than 8.

char arr[4];

at least 8

strcpy(arr, "overflow"); or strncpy(arr, "overflow", 8);

at least 8

2. Fill in the correct expression:

char s1[MAX1];
char s2[MAX2];

getname(s2, MAX2); /* Initializes the string s2 */

strncpy(s1, s2, MAX-1);

3. a) Fill in the argument for malloc so that it allocates just enough space for the remaining code.

char **s = malloc(3 * sizeof(char *));
char p[10] = "Paul";
char q[10] = "Karen";
char r[10] = "Francois";

*s = p;
*(s+1) = q;
*(s+2) = r;

b) Write the above 3 statements using array notation so that they have the same effect.

s[0] = p;
s[1] = q;
s[2] = r;

c) Write one C statement to truncate the string "Francois" so that the following printf statement prints Fran

printf("%s\n", r);

r[4] = '\0';

d) Give the type of the following expressions. If the expression is not a pointer, also give its value.

&s char ***

*s char *

**s char 'p'

s[0] char *

&s[1] char **

*s[0] char 'p'

4. Given the two declarations below circle the C statements that will compile without warning or error (other than those about unused variables):

```
int *p;
int i = 10;
```

char q = i; char *c = p; double *f = &i; double d = i;

5. Show what is written to the file for each of the fprintf and fwrite statements. Show the value(s) in decimal and binary. ASCII values for characters: '0' is 48 (0x30), '1' is 49 (0x31), '6' is 54 (0x36)

```
int i = 16;
fprintf(fp,"%d", i);
```

49 | 54 00110001 | 00110110

```
int j = 0x10;
fprintf(fp,"%d", j);
```

49 | 54 00110001 | 00110110

```
fwrite(&i, sizeof(int), 1,fp);
```

00000000 | 00000000 | 00000000 | 00010000

```
char c = i;
fwrite(&c, sizeof(char), 1,fp);
```

00010000
