

CSC209H Worksheet: Strings

- Write a program that declares 3 strings. The first named `first` should be set to the value "Monday", and be stored on the stack frame for `main`. `second` should be a string literal with the value "Tuesday". `third` should have value "Wednesday" and be on the heap. The pointers for `second` and `third` will be in stack frame for `main`. Then beside it, draw the memory model for your program after all three strings have been created. Using the starter code posted on the course website, type your program into your computer (or work with a friend on their computer.)

```
int main()
```

Section	Address	Value	Label
Read-only	0x100		
	0x104		
	0x108		
	0x10c		
	0x110		
	⋮	⋮	
Heap	0x23c		
	0x240		
	0x244		
	0x248		
	0x24c		
	⋮	⋮	
stack frame for main	0x454		
	0x458		
	0x45c		
	0x460		
	0x464		
	0x464		
	0x468		
	0x46c		
	0x470		
	0x474		
	0x478		
	0x47c		

CSC209H Worksheet: Strings

2. Add to your program so that it declares an array `string_list` of 3 pointers to char and point the elements to `first`, `second`, and `third`, respectively. So now you have an array of strings. Where is the memory allocated for this array? Add to your memory model diagram as well. Once you have this complete, show it to a TA or the professor and ask for the next handout which has the solutions to questions 1 and 2 and a place to answer question 3.
3. Now, add a new function `build_month_list` that allocates, initializes and returns an array of 3 strings with the values "January", "February", and "March". All the strings need to be mutable, so that the `main` function can shorten them. Remember to uncomment the code in `main` that tests that `build_month_list` is testable.
4. If you are finished (or if you can't figure out why your code isn't working), draw a memory diagram illustrating your program at the moment just before `build_month_list` returns.

CSC209H Worksheet: Strings

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

// Part 3: Implement build_month_list.

int main() {
    // Part 1: Declare and initialize first, second, and third.
    char first[7] = "Monday";
    char *second = "Tuesday";
    char *third = malloc(10 * sizeof(char));
    //third = "Wednesday"; <- DOES NOT WORK make sure you understand why!
    strcpy(third, "Wednesday");

    printf("%s %s %s\n", first, second, third);

    // Part 2: Declare and initialize string_list.
    char *string_list[3];
    string_list[0] = first;
    string_list[1] = second;
    string_list[2] = third;

    printf("%s %s %s\n", string_list[0], string_list[1], string_list[2]);

    char **months = build_month_list();
    for(int i = 0; i < 3; i++) {
        printf("%s ", months[i]);
    }
    printf("\n");

    for(int i = 0; i < 3; i++) {
        months[i][3] = '\0';
        printf("%s ", months[i]);
    }
    printf("\n");

    return 0;
}
```
